SUNFOLD · Segmentation and testing strategy

Oct 28, 2026 · @Veselin

SUNFOLD is a skincare brand with five products and a limited-edition launch. Every segment and test below is built in Klaviyo and ready to switch on.

The plan does two jobs. Segments send each message only to the people it fits. A/B tests then improve the messages that get the most traffic, one variable at a time.

Segments

Seven segments split the list by buying stage and engagement. Each one has one job.

Segment	Definition in Klaviyo	What it is for
Buyers · One-time customers	Placed Order equals 1, over all time	Second-order push: a routine add-on 2 to 3 weeks after the first order
Buyers · Repeat customers (2+ orders)	Placed Order at least 2, over all time	Early access and new launches before the full list
Buyers · VIP (spent $150+)	Placed Order Value at least $150, over all time	Thank-you perks, first look at limited batches, no discounts
Win-back · Lapsed buyers	Placed Order at least once over all time AND zero times in the last 90 days	Win-back flow: what's new, then a free-shipping offer
Product · Lip Treatment buyers	Placed Order where item name contains Peach or Watermelon	Cross-sell the second flavor and the lip duo
Subscribers · Never purchased	In Email List AND Placed Order zero times, over all time	Education and social proof before any offer
Sunset · Unengaged 120 days	In Email List AND no opens AND no clicks in the last 120 days	Last-chance email, then suppress to protect deliverability

The Watermelon 2 email also uses an exclusion segment, Ordered Watermelon Lip Treatment, so buyers are not chased after they order.

A/B test plan

Three tests are set up in Klaviyo as Drafts. Each changes one line and keeps the rest of the email the same.

Test	Variation A	Variation B	Hypothesis	Winning metric	Decision rule
AC1 subject line (Abandoned Cart, email 1)	Your cart is still glowing	You left something good behind	Naming the saved pick gets more people back to the cart than the brand line	Click rate	Auto winner at statistical significance; no winner after 30 days, keep A and test the preview text next
BA1 preview text (Browse Abandonment, email 1)	Here's the one-minute version.	Everything you'd want to know before you try it.	Shoppers still comparing respond to a promise of full answers	Click rate	Auto winner at significance; no clear winner, keep A, the shorter line
W1 subject line (Watermelon launch, email 1)	Watermelon just dropped (you get it first)	Early access: Watermelon is yours for 24 hours	Stating the 24-hour window up front adds urgency without a discount	Click rate	20% test group, 6-hour test, winner goes to the other 80% the same day

Why click rate, not open rate. Apple Mail Privacy Protection marks many emails as opened automatically, so open rate overstates results. Clicks show real interest.

Why W1 tests the subject, not the send time. The email promises 24 hours of early access. Splitting the send time would give some subscribers a shorter window than others.

Testing rules

- One variable per test, so the result points to one cause.
- Test flows first: they run every day, so they reach a result faster than one-off campaigns.
- Let a test run until Klaviyo marks a winner; don't stop it early on a good first day.
- Log every result, including the losers, and roll the winner into the base email before the next test.
- Next tests in line: AC3A free-shipping code vs no code, and the BA2 order (kit first vs small products first).
